

On the temporal and structural organization of phonological information

François Pellegrino (Université de Lyon & CNRS, France)

Adopting a Shannon-based and cross-linguistic approach, I will present our recent findings on phonological information organization among sound systems at the phoneme and syllable scales. I will also discuss various aspects related to the temporal distribution of information and its regulation in the light of the close relationship existing between temporal structure of speech and neural oscillatory activities as increasingly evidenced during the last two decades.
